SUMMARY

Full-stack developer with nearly three years of experience building and supporting enterprise financial systems in Java/Spring Boot and Angular. At BNP Paribas, owned code across a proprietary payment platform handling 170+ CRUD operations and millions of daily transaction records, Angular UI through Spring REST services to normalized MySQL and delivered 20+ production releases via Jenkins CI/CD.

TECHNICAL SKILLS

Languages: Java (OOP, Collections, Generics, Exception Handling, Multithreading), TypeScript, JavaScript, SQL, PL/SQL, HTML5, CSS3

Backend: Spring Boot, Spring MVC, REST API design, Microservices, Node.js, Express, Maven

Frontend: Angular 12–18, RxJS, Bootstrap, responsive UI, client-side performance tuning

Databases: MySQL, PostgreSQL (normalized schema design, stored procedures, complex joins, query optimization)

DevOps & Tools: Git, Jenkins, GitHub Actions, Artifactory, Docker, CI/CD pipelines, AWS (EC2, S3, Elastic Beanstalk), Linux/Shell, JIRA

PROFESSIONAL EXPERIENCE

Makerspace Volunteer — Creation Station | [Wayne County Public Library — Wooster, OH](#) **Sep 2026 – Present**

- Support patrons of all ages in a public makerspace, assisting with 3D printers (Ender 3 V3 SE, Bambu P1S), a 10W diode laser cutter, sublimation printing, and Cricut design work.
- Help patrons prepare and troubleshoot design files across STL, SVG, DXF, and image formats, and walk them through equipment standard operating procedures safely.
- Translate technical processes into plain language for non-technical users of all ages.

Associate Software Engineer | [BNP Paribas ISPL — Chennai, India](#) **Jul 2021 – Oct 2023**

- Maintained and enhanced a proprietary financial platform supporting 170+ CRUD operations, 10+ stored procedures, and millions of daily transaction records owning changes across the Angular front end, Java/Spring services, and MySQL data layer.
- Cut page-load time 30% on a high-traffic module used by 600+ daily users by moving sorting and filtering client-side and eliminating redundant API roundtrips.
- Resolved critical software defects and performance issues across the full stack, improving overall application performance by 40% through systematic debugging, API optimization and client-side refactoring.
- Reduced query execution time 20% on the platform's heaviest reporting paths by normalizing MySQL schemas, rewriting joins, and tuning stored procedures.
- Designed Spring-based microservices for a core payment engine using dependency injection and clear service boundaries, lowering calculation latency in the brokerage calculator module.
- Built and secured RESTful backend services in Java/Spring and Node.js, integrating securely with downstream systems that process sensitive financial data.
- Coordinated 20+ stable production releases through Jenkins and Artifactory CI/CD, covering analysis, code review, testing, deployment, and post-release support in an Agile/Scrum team.
- Debugged and resolved critical production defects across the full stack and authored internal documentation that reduced repeat support requests from non-technical teams.

Developer Intern | [BNP Paribas ISPL — Chennai, India](#) **Feb 2021 – Jun 2021**

- Developed internal CRUD tools using reusable Angular components and responsive layouts for large, filterable datasets.
- Designed responsive UI components for large datasets with filtering and structured visualization for easy user interaction.

PROJECTS

Ledger — Payment & Expense Tracking Dashboard | [Angular 18, Spring Boot, MySQL, REST, Docker](#) **Jan – Mar 2025**

- Full-stack transaction dashboard modeled on the payment-processing domain from my BNP Paribas work: sortable, filterable transaction table with live-updating category totals. [Live demo](#) · [Source](#)
- Exposed add/delete operations through REST endpoints over a normalized MySQL schema with correct HTTP semantics; containerized with Docker and deployed the front end to GitHub Pages.

Pipeline — CI/CD-Deployed Task & Sprint Manager | [Angular 18, Node.js, Express, GitHub Actions](#) **Apr – Jun 2025**

- Kanban task manager where every commit runs build, test, and deploy through a GitHub Actions pipeline with zero-downtime releases. [Live demo](#) · [Source](#)
- Added localStorage persistence and RxJS catchError fallbacks so task state survives refreshes and the app stays usable when the backend is offline.

EDUCATION

Bachelor of Technology, Information Technology | [Anna University — Chennai, India](#) **2017 – 2021**

Relevant Coursework: Computer Architecture, Design and Analysis of Algorithm, Data Structures, Operating Systems and Database Systems.
